Planning Commission and Wasatch Association of Business Commended on a Job Well Done

4 Apr 1985

The stock and trade of any newspaper is of course, news. This trail of news in many cases has its roots in controversy and strife, as such, it is a pleasant task to compliment the harmony that has been displayed between Heber City, the Heber Planning Commission and the Wasatch County Association of Businesses.

An issue that at first glance had all the marks of being a knock down fight between businesses and government was shaping up when the sign ordinance was first proposed. But through the efforts of these parties the fight never took place. Instead, understanding was the first order of business.

By the efforts of these interested groups guidelines were established for the placement of signs within our community. The matter did not get out of hand and allow a "Las Vegas Strip" sign ordinance but rather allows the prominent yet tasteful display of business signs.

And last but not least this is an example of what can be achieved when government and private enterprise work together.

We at the Wave congratulate all concerned for a job well done.

to visit a nearby farm. This is especially fun if there are new born animals that the children can pet or feed. You could point out that spring is a time of new beginning and new life.

7. EASTER TREE: Find a branch about two feet high with

ribbon, butterflies, etc. Makes a pretty center piece or room decoration.

Readers: Send your ideas to PARENTS' HELP LINE, 250 North, 500 West, Heber City, UT. 84032.

Photofun

Wave Columnist

In spite of the sophisticated camera equipment available today there is one area of photography where photographers are on their own. Your camera might have the latest in automatic metering, aperture and shutter selection, even auto-focusing, but if it isn't steady as a rock when you push the shutter your photos are going to suffer.

One so called "rule" of photography is never to shoot at a slower shutter speed than the focal length of the lens you are using. For example, if you are using a 100 mm lens always use a 1/100 or faster shutter speed. This is fine as a generality but there are too many variables involved for it to be considered a hard and fast dictum. Weather conditions, aperture and shutter speed requirements, and our own physical capabilities all play a part in how steady we can hold a camera.

It is a good idea to determine

If we admit to ourselves that we aren't as steady as we thought we were, what can be done about it? Another short test should provide the answer.

Shoot another series of pictures starting with a shutter speed you consider yourself steady at. Make one exposure each at progressively faster shutter speeds until you reach your camera's limit, usually 1/1000 sec. on most SLRs. Now for the clincher. Make the same series of photographs only this time mount your camera on a sturdy tripod. Use a clack cable release if you have one, but be sure to gently press the shutter release. Closely examine the resulting slides, prints, or negatives. Use a magnifier if you have to. You'll find that, compared to your steadiest, fastest hand held speeds, the tripod pictures will be sharper. This should tell you something.

Before you start complaining that you don't have a tripod, or don't even want one, let me offer some advice.

There are many situations
